3. INSTALLATION

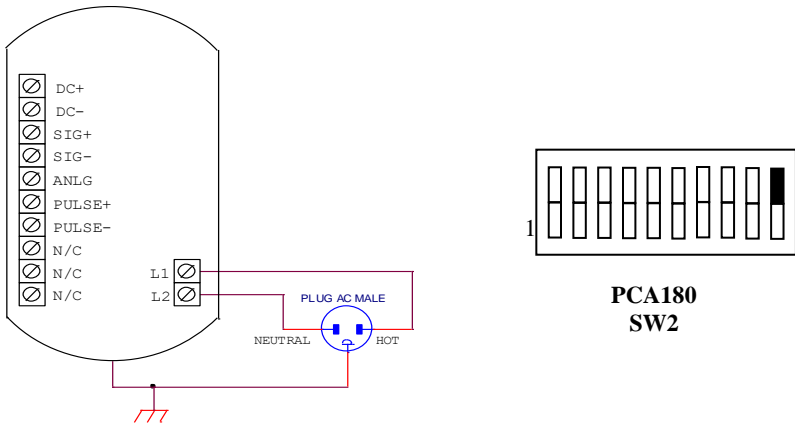

3.1 Power Supply

DC Power (13-30 VDC)

AC Power (100-240 VAC)

AC power for CAT2 requires an optional circuit board, PCA182. The Alarm option (PCA184) is not available when the AC Power option is equipped.

3.2 **Flowmeter Input**

The Preamp circuitry for conditioning the flow signal is located on PCA180. The following drawings illustrate typical connections and switch settings on PCA180 for various input signals.

3.3 Pulse Output

The pulse output circuitry for CAT2 is located on PCA180. The pulse output is scalable by a factor of 1, 2, 4, 8, 16 and 32 of the input frequency by selecting the proper switch on SW2. Scaling of the pulse output may be limited if an analog output is used in conjunction with the pulse output. The following drawings illustrate typical connections and switch settings for various pulse output options.

Pulse Scaling

Scaling Factor (Divide by N of Input)	Switch Setting (SW2, PCA180)
1	SW2-1 ON
2	SW2-2 ON
4	SW2-3 ON
8	SW2-4 ON

3.4 Analog Output

CAT2 provides an Analog Output option that will output an analog current or voltage that is proportional to the flow rate. The Analog Output for CAT2 requires an optional circuit board, PCA181.

Analog Output

The input frequency is scaled using SW2 on PCA180 so that the preamp output frequency at max flow is between 75 and 150 Hz. For example, if the max flow input signal is 1,000 Hz, SW2-4 should be in the ON position to divide the preamp signal by 8 so that the max frequency out of the preamp is 125 Hz. Refer to the table in the previous section for the appropriate switch settings. If the Pulse Output option is used in conjunction with the Analog Output, the Pulse Output frequency will be limited by this scaling factor.

There are 3 potentiometers on PCA181 for ZERO and SPAN adjustment. The ZERO pot adjusts the no flow output, while COURSE SPAN and FINE SPAN adjusts the max flow output. All pots are labeled accordingly on the circuit board and may be accessed by removing the top plate from CAT2. The 0-20mA, 0-5V and 0-10V options require no ZERO adjustment. Contact the factory for detailed calibration instructions before making any adjustments.

Analog Output Response Time: The analog output response time to reach steady state due to a change in the flow rate is approximately two (2) seconds.

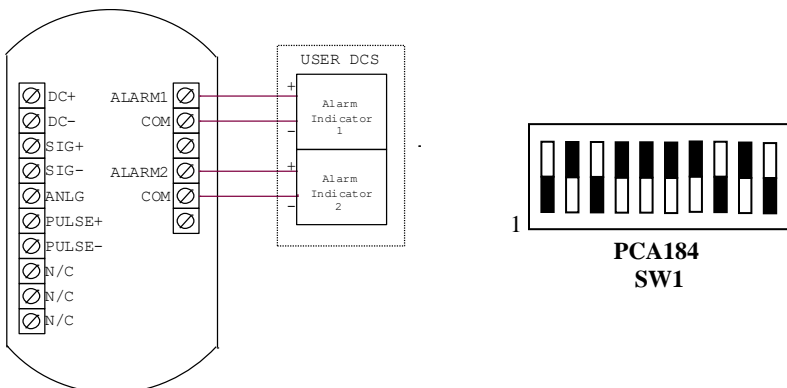

3.5 Alarm Outputs

CAT2 provides an optional High/Low Flow Alarm feature. The Alarms require an optional circuit board, PCA184. The Alarm option is not available when the AC Power option is equipped. The following drawings illustrate typical connections and switch settings for various alarm output options.

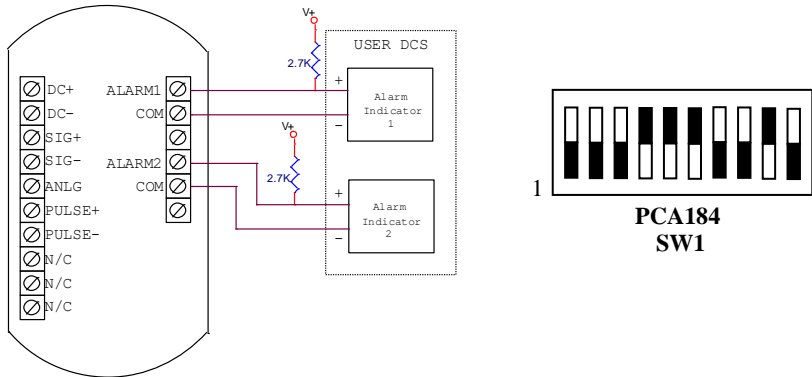

Hi/Lo Alarm Relay

Hi/Lo Alarm TTL(0-5V)

Hi/Lo Alarm Open Collector

3.6 Wiring Note

When installing CAT2, it is a good practice to use shielded cables for all input and output signals. The shield should be connected to the earth ground lug on the CAT2. The shield on the opposite end of the cable should be left open. Connections are made to the CAT2 terminal blocks using wire gauges 16 to 28 AWG and 12 to 26 AWG (AC Power), tightening Torque 0.22 to 0.25Nm.

This wiring practice is mandatory in order to comply with the requirements for Electromagnetic Compatibility, as per EMC-Directive 2014/30/EU of the Council of European Community.
